

Defining a high-confidence CNV-high T-cell population

Source-paper QC retained; thresholds are calculated independently within each sample

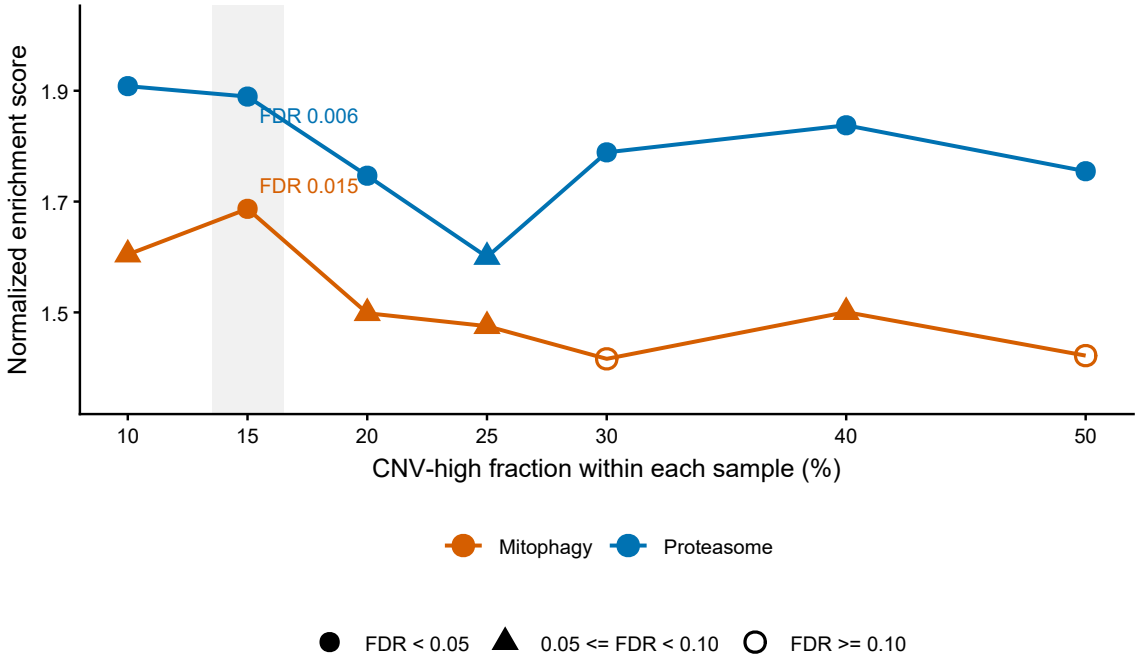

A Within-sample definition of the CNV-high core

Red: upper 15% per sample; red dashed: q85; blue dotted: pooled non-T reference q95 = 0.027 (15.4% of candidate cells above)

B Pathway robustness across CNV-high fractions

Paired pseudobulk GSEA; BH FDR across the complete KEGG collection

C Cell retention

Minimum retained cells among the six samples
